

Amazona vittata

Puerto Rican parrot

Family (Psittacidae)

Kingdom (Animalia)

Status (Endangered)

Description

A bright green bird about one foot in length, with a red forehead, blue primary wing feathers, and a flesh-colored bill and feet. It feeds mainly on wild fruits, especially sierra palm, but also consumes flowers and tender shoots. Its diet includes a wide variety of fruits, with tabonuco becoming important when other food sources are scarce.

Location/Habitat

Found in the Luquillo Mountains of Puerto Rico, primarily within El Yunque National Forest, the species occupies tabonuco and palo colorado forests, especially at their interface. It inhabits humid, mountainous forest environments, using areas with available nesting sites in trees and occasionally nearby private lands surrounding the forest.
