

Antrostomus noctitherus

Puerto Rican nightjar

Family (Caprimulgidae)

Kingdom (Animalia)

Status (Endangered)

Description

A small, dark-colored nightjar about 21.5 cm long, with wings measuring around 135 mm. It has russet markings on the throat, upper breast, and wing edges, along with a wide mouth bordered by conspicuous bristles, typical of nightjars. The tail feathers show limited white coloration compared to related mainland species.

Location/Habitat

Found in southwestern Puerto Rico, particularly in the Guánica Forest, Susúa Forest, and Guayanilla Hills, the species inhabits dry semi-deciduous forests and woodlands with closed tree canopies. It occurs mainly in limestone and serpentine forest habitats, preferring relatively undisturbed areas with dense vegetation cover.
