

Auerodendron pauciflorum

No common name – a tree

Family (Rhamnaceae)

Kingdom (Plantae)

Status (Endangered)

Description

An evergreen shrub or small tree that can reach up to 5 m in height. It has opposite or subopposite, ovate to ovate-elliptic leaves that are glabrous and marked with minute black glandular dots. The plant bears small stipules at the base of the petiole and produces 2–3 flowers in the leaf axils with a broadly campanulate calyx. The fruit is currently unknown.

Location/Habitat

Found in the limestone (karst) region of northern and northwestern Puerto Rico, within the subtropical moist forest zone. It occurs in seasonal evergreen or semi-evergreen forests at elevations of 150–300 meters, on shallow, well-drained, alkaline soils among limestone outcrops, in terrain with sinkholes, caves, and rugged hills.
