

# *Callicarpa ampla*

Capa rosa

**Family** (Lamiaceae)

**Kingdom** (Plantae)

**Status** (Endangered)

## Description

Is a critically endangered, evergreen small tree or shrub endemic to the montane forests of Puerto Rico, particularly in the Luquillo Range. Growing up to 15 meters (50 feet) tall, it is characterized by 4-sided (tetragonal) twigs, elliptical green leaves with rusty-white undersides, and small, purple-turning berries.

## Location/Habitat

Is a critically endangered tree endemic to the Luquillo Mountains (El Yunque National Forest) in northeastern Puerto Rico. It thrives in high-elevation wet montane forests, specifically in palo colorado forest types.
