

# *Calyptronoma rivalis*

Palma de manaca

**Family** (Arecaceae)

**Kingdom** (Plantae)

**Status** (Threatened)

## Description

Is a threatened, single-stemmed palm native to Puerto Rico and Hispaniola. It thrives in wet, riparian habitats, reaching 30–49 feet (9–15 meters) in height with a smooth, gray-brown trunk and large, feather-shaped leaves. It is distinguished by its, drooping, clustered flowers and small, reddish-brown fruits.

## Location/Habitat

Is a threatened palm species native to the Caribbean, specifically found along shaded stream banks, arroyos, and in waterlogged areas of Puerto Rico and Hispaniola. They are primarily located in the north/northwestern karst region of Puerto Rico, inhabiting wet limestone forests at low elevations.
