

Catesbaea melanocarpa

No common name

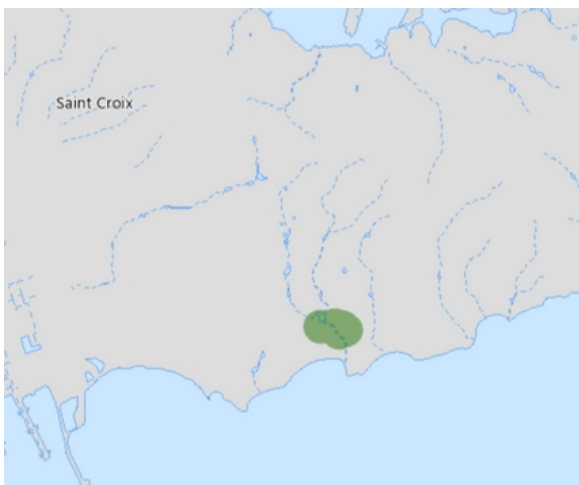

Family (Rubiaceae)

Kingdom (Plantae)

Status (Endangered)

Description

Is a thorny shrub that has fragrant white flowers with small black berry fruit. It grows abundant flowers but very few fruit are ripe at any one time. Birds eat the fruits and disperse the seeds.

Location/Habitat

This species is known to occur on one site in the island of St. Croix, US Virgin Islands, and two sites in Puerto Rico (Guánica Forest and Peñones de Melones Cabo Rojo). It is also present on the Caribbean islands of Antigua, Barbuda, and one island in the French Overseas department of Guadeloupe.
