

Eleutherodactylus cooki

Guajon

Family (Eleutherodactylidae)

Kingdom (Animal
)

Status (Threatened)

Description

E. cooki is a medium sized species, averaging 37mm. The color is brown and the males have a yellow patch in the throat. The eyes and the digital disks are large compared with other *Eleutherodactylus*..

Location/Habitat

The coquí guajón's range is limited to only seven municipalities in southeast Puerto Rico and mostly within private lands. The species is considered a habitat specialist since populations only occur within "guajonales" and/or streams with patches of rocks. The unique hydrological and geological combination of these habitats is considered one of the most important attributes for a coquí guajón population occurrence and persistence.
