

Gesneria pauciflora

No common name

Family (Gesneriaceae)

Kingdom (Plantae)

Status (Threatened)

Description

Gesneria pauciflora, a rare shrub species, is endemic to Puerto Rico, particularly within the Maricao Commonwealth Forest. It's a small, gregarious shrub that typically grows in moist, rocky forested habitats along rivers and streams. The plant has dark green, glossy leaves and produces tubular, orange or yellowish flowers, often in clusters of 1 to 3.

Location/Habitat

In three discrete populations were known to exist in the mountain range of the municipalities of Maricao and Sabana Grande (Río Maricao, Río Seco, and a tributary of Río Lajas). Two of the three populations were located within the Maricao Commonwealth Forest.
