

Juglans jamaicensis

West Indian Walnut

Family (Juglandaceae)

Kingdom (Plantae)

Status (Endangered)

Description

It is a threatened native tree of the Greater Antilles. It grows between 5 and 30 m tall, with gray-brown bark, compound leaves, drupe fruits, and valuable wood. It prefers humid montane forests and is monoecious.

Location/Habitat

Found in wet montane forests of Cuba, Hispaniola, and Puerto Rico. It thrives in tropical climates at elevations up to 1100m, often on banks and floodplains of streams, with the only known natural population in Puerto Rico located in the Guilarte Commonwealth Forest.
