

Leptocereus grantianus

No common name

Family (Cactaceae)

Kingdom (Plantae)

Status (Endangered)

Description

Leptocereus grantianus is a sprawling, nearly spineless cactus endemic to Culebra Island. The species was first discovered and collected on the Island of Culebra in 1932 by Major Chapman Grant. This cactus was later described by Nathaniel Britton from material cultivated by Grant.

Location/Habitat

L. grantianus is still known to occur only on Culebra Island, but the species' abundance is now estimated at around 261 individuals in six localities within three main populations: 191 individuals in three localities within Villas Mi Terruño, 20 individuals in Playa Melones, and 50 individual in two sites within Punta Soldado
