

Mitracarpus maxwelliae

No common name

Family (Rubiaceae)

Kingdom (Plantae)

Status (Endangered)

Description

M. maxwelliae is a low, densely-branching, moundlike shrub which may reach approximately 20 centimeters in height. The somewhat woody branches are striate and sharply 4-angled. The leaves are opposite, sessile, linear or linear-lanceolate, densely scabrous, and from 1 to 3 centimeters long and 2 to 5 millimeters wide.

Location/Habitat

Only 2 populations of this species are currently known: one at Monte de la Brea and another at Monte Las Pargas, both located at La Montalva Ward in the municipality of Guánica. The population at Monte de la Brea is within the boundaries of the Guánica Commonwealth Forest, whereas the population at Monte Las Pargas occurs in a public land slated for development.
