

# *Myrcia pagani*

No common name – a small tree

Family (Myrtaceae)

Kingdom (Plantae)

Status (Endangered)

## Description

Evergreen tree that can reach up to 9 meters in height. It has mottled, scaly bark, with an orange-brown inner bark, and young branches covered in fine hairs. Its leaves are opposite, leathery, aromatic, and elliptical in shape, with visible glandular dots.

## Location/Habitat

It is found in the north and northwest of Puerto Rico, in humid subtropical forests of evergreen or semi-evergreen type. The terrain has varied topography with hills, canyons, sinkholes, and underground rivers. The soils are shallow, well-drained, and alkaline, interspersed with limestone outcrops.
