

Ottoschulzia rhodoxylon

palo de rosa

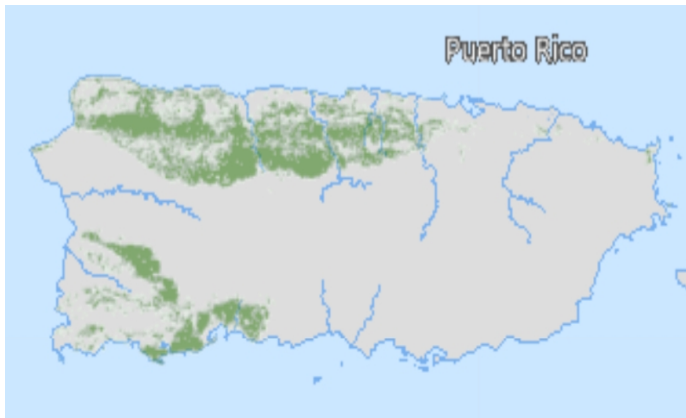

Family (Icacinaceae)

Kingdom (Plantae)

Status (Threatened)

Description

Small evergreen tree that can reach up to 15 meters in height, although it is usually shorter. It has alternate, thick, leathery leaves, elliptical to ovate in shape. Its flowers may appear singly or in clusters, and its fruit is a drupe with a single seed. The inner wood of the tree is reddish in color.

Location/Habitat

It is found in dry, moist, and very moist forests. It grows in well-drained, generally alkaline soils derived from limestone or serpentine, and is located on slopes, summits, and canyon or ravine bottoms. Its distribution depends on moisture: in dry areas it is found in more humid spots, while in humid areas it appears in drier zones. It can be found from low elevations up to mountainous regions.
