

Peperomia wheeleri

wheeler's peperomia

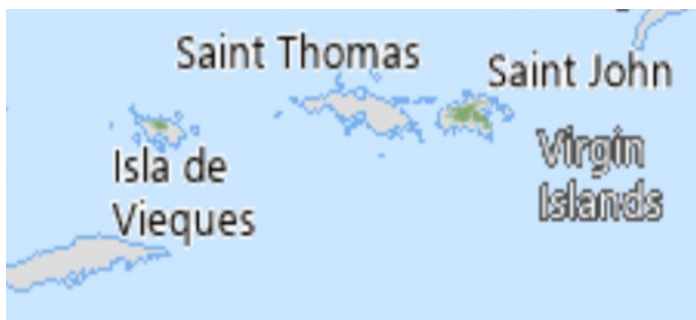

Family (Piperaceae)

Kingdom (Plantae)

Status (Endangered)

Description

Evergreen herb, erect and hairless, that can reach up to 1 meter in height. It has opposite, fleshy, elliptical leaves with prominent veins arising from the base. Its inflorescences are in the form of elongated spikes where very small flowers are clustered. It is distinctive for its succulent texture and its simple structure adapted to humid environments.

Location/Habitat

Located on the island of Culebra and nearby cays, in a subtropical dry forest environment with more humid areas of seasonal semi-evergreen forest. It inhabits areas of irregular topography with shallow soils among large granodiorite rocks, where it grows in the understory on accumulated humus over these rocky surfaces.
