

Polystichum calderonense

No common name – a fern

Family (Dryopteridaceae)

Kingdom (Plantae)

Status (Endangered)

Description

Evergreen terrestrial fern with fronds up to 60 cm long, dark green in color and with a rigid texture. It has sori on the underside of the leaves, covered by a thin indusium. Its rhizome is covered with dark, shiny scales.

Location/Habitat

The species is located in the central and south-central mountains of Puerto Rico, growing on moist, shaded, non-calcareous ledges at elevations between 1,000 and 1,150 meters, within subtropical moist and very moist forests.
