

Pterodroma hasitata

black-capped petrel

Family (Procellariidae)

Kingdom (Animalia)

Status (Endangered)

Description

Pelagic seabird that spends most of its life in the open ocean across the western Atlantic and the Caribbean. It feeds mainly in oceanic areas where food rises to the surface. It only uses land for nesting, primarily in mountainous regions. It is the only species of its genus that currently breeds in the Caribbean.

Location/Habitat

The species is located in inland nesting areas along the southern coast of Hispaniola (Haiti and the Dominican Republic), at elevations between 1,700 and 2,300 meters. It occurs in mountainous terrain within 30 km of the coast, with loose soils or decomposing vegetation, dominated by *Pinus occidentalis*, and featuring caves, crevices, and cavities in karst or limestone formations.
