

Schoepfia arenaria

no common name – a hemiparasitic shrub or small tree

Family (Schoepfiaceae)

Kingdom (Plantae)

Status (Threatened)

Description

It is an evergreen shrub or small tree that can reach up to 6 meters in height. It has simple, glossy leaves and produces tubular yellow flowers. Its fruit is bright red and contains a single seed. The wood is hard and light brown in color.

Location/Habitat

The species is found in northern Puerto Rico on limestone hills ("mogotes") within evergreen and semi-evergreen forests, at elevations of 150 to 350 meters. It inhabits subtropical moist forest with karst topography, including steep hills, sinkholes, caves, and underground streams, with well-drained, shallow limestone soils.
