

Thelypteris inabonensis

No common name – a fern

Family (nombre familia)

Kingdom (Plantae)

Status (Endangered)

Description

It is a terrestrial fern with fronds up to 60 cm long and a slender rhizome covered with dark scales. It has narrow leaves with numerous pairs of pinnae and abundant fine hairs. Its sori are located on the veins and are covered by a ciliate indusium. It is distinguished by the presence of scales and hairs on the rachis.

Location/Habitat

It is found in lowland montane rainforests at elevations of 1,120 to 1,250 meters. It is found along the banks of streams within mountain palm forests (*Prestoea montana*), such as along the Inabón River in Ponce, and also in shaded, humus-rich areas near mountain peaks, in mossy forests with palms in Ciales. Both locations are within the Toro Negro State Forest.

Puerto Rico
