

Thelypteris verecunda

No common name - a fern

Family (Thelypteridaceae)

Kingdom (Plantae)

Status (Endangered)

Description

A terrestrial fern with creeping rhizomes and dimorphic fronds covered in fine hairs. It has small leaves, with fertile and sterile leaves differing in shape. Its sori are small and develop on the fertile fronds. It is characterized by its small size and dense covering of hairs.

Location/Habitat

Found in the karst region of northwestern Puerto Rico, characterized by limestone formations. It inhabits terrain ranging from very rugged to gently rolling hills, featuring canyons, sinkholes, and underground rivers. It is found in shallow, well-drained, alkaline soils interspersed among limestone outcrops.
