

Varronia bellonis

No common name

Family (Boraginaceae)

Kingdom (Plantae)

Status (Endangered)

Description

Is an endangered, endemic, dioecious shrub found only in Puerto Rico, growing 3.3–6.6 ft tall with slender, hairy twigs and white flowers. It inhabits steep slopes and sunny road banks in serpentine soils (Maricao, Susua) or limestone forests (Río Abajo).

Location/Habitat

Is an endangered, endemic shrub found in Puerto Rico, restricted mainly to the public forests of Maricao, Susúa, and Río Abajo. It inhabits steep slopes, sunny road banks, and river margins on both serpentinite and limestone soils, primarily within the west-central mountains and northern moist karst regions.
